# Part 0

### Offline Model: SCPM

### Algorithm 1 Offline SCPM

```
intitialize k
initialize m
initialize n
initialize x
initialize s
initialize z
initialize a = random number between (1,2) of size k x m
initialize p = random number between (0,1) of size m x 1
initialize q = random number between (10,20) of size k x 1
initialize pi = a^T p + random number between (0, 0.2) of size k x 1
initialize w
objective1 = Maximize(pi^T * x - z + w * \Sigma(logs_i/m))
objective2 = Maximize(pi^T * x - z + w * \Sigma(1 - e^{-s_i}/m))
constraints = [a^Tx - z + s == 0, x \le q, x >= 0, s >= 0]
problem1 = Problem(objective1, constraints)
problem1.solve(solver=CVXOPT)
```

### Online Model 1: SCPM

### Algorithm 2 Online SCPM

```
intitialize k
initialize m
initialize n
initialize x
initialize s
initialize z
initialize a = random number between (1,2) of size k x m
initialize p = random number between (0,1) of size m x 1
initialize q = random number between (10,20) of size k x 1
initialize pi = a^T p + random number between (0, 0.2) of size k x 1
initialize w
objective1 = Maximize(pi^T * x - z + w * \Sigma(logs_i/m))
objective2 = Maximize(pi^T * x - z + w * \Sigma(1 - e^{-s_i}/m))
part 1:
constraints = [x[n:] == 0.0, a^Tx - z + s == 0, x <= q, x >= 0, s >= 0]
problem1 = Problem(objective1, constraints)
problem1.solve(solver=CVXOPT)
part 2:
c = x[0:n]
constraints = [x[0:n]-c == 0, a^Tx-z+s == 0, x <= q, x >= 0, s >= 0]
                       Problem(objective1,
                                                  constraints)
problem2
                                                                    prob-
lem2.solve(solver=CVXOPT)
```

### Online Model 2: SCPM

## Algorithm 3 Online SCPM

```
intitialize k
initialize m
initialize n
initialize x
initialize s
initialize z
initialize a = random number between (1,2) of size k x m
initialize p = random number between (0,1) of size m x 1
initialize q = random number between (10,20) of size k x 1
initialize pi = a^T p + random number between (0, 0.2) of size k x 1
initialize w
objective1 = Maximize(pi^T * x - z + w * \Sigma(logs_i/m))
objective2 = Maximize(pi^T * x - z + w * \Sigma(1 - e^{-s_i}/m))
part 1:
constraints = [x[n:] == 0.0, a^Tx - z + s == 0, x <= q, x >= 0, s >= 0]
problem1 = Problem(objective1, constraints)
problem1.solve(solver=CVXOPT)
part 2:
for l=n;l;k;l++do
  c = x[0:l]
  constraints = [x[0:l] - c == 0, x[l+1,:] == 0, a^Tx - z + s == 0, x <=
  q, x >= 0, s >= 0
end for
c = x[0:n]
constraints = [x[0:n]-c == 0, a^Tx-z+s == 0, x <= q, x >= 0, s >= 0]
problem2 = Problem(objective1, constraints)
problem2.solve(solver=CVXOPT)
```

# Part 3

### Offline Model: SCPM

## Algorithm 4 Offline SCPM

```
intitialize k
initialize m
initialize n
initialize x
initialize s
initialize b = 1000 of size k x 1
initialize a = random number between (1,2) of size k x m
initialize p = random number between (0,1) of size m x 1
initialize q = random number between (10,20) of size k x 1
initialize pi = a^T p + random number between (0, 0.2) of size k x 1
initialize w
objective1 = Maximize(pi^T * x + w * \Sigma(logs_i/m))
objective2 = Maximize(pi^T * x + w * \Sigma(1 - e^{-s_i}/m))
constraints = [a^Tx - b + s == 0, x \le q, x >= 0, s >= 0]
problem1 = Problem(objective1, constraints)
problem1.solve(solver=CVXOPT)
```

### Online Model 1: SCPM

### Algorithm 5 Online SCPM

```
intitialize k
initialize m
initialize n
initialize x
initialize s
initialize b = 1000 of size k x 1
initialize a = random number between (1,2) of size k x m
